

JS Advanced Exam

Problem 1. Hotel Reservation

Environment Specifics

Please be aware that every JS environment may **behave differently** when executing code. Certain things that work in the browser are not supported in **Node.js**, which is the environment used by **Judge**.

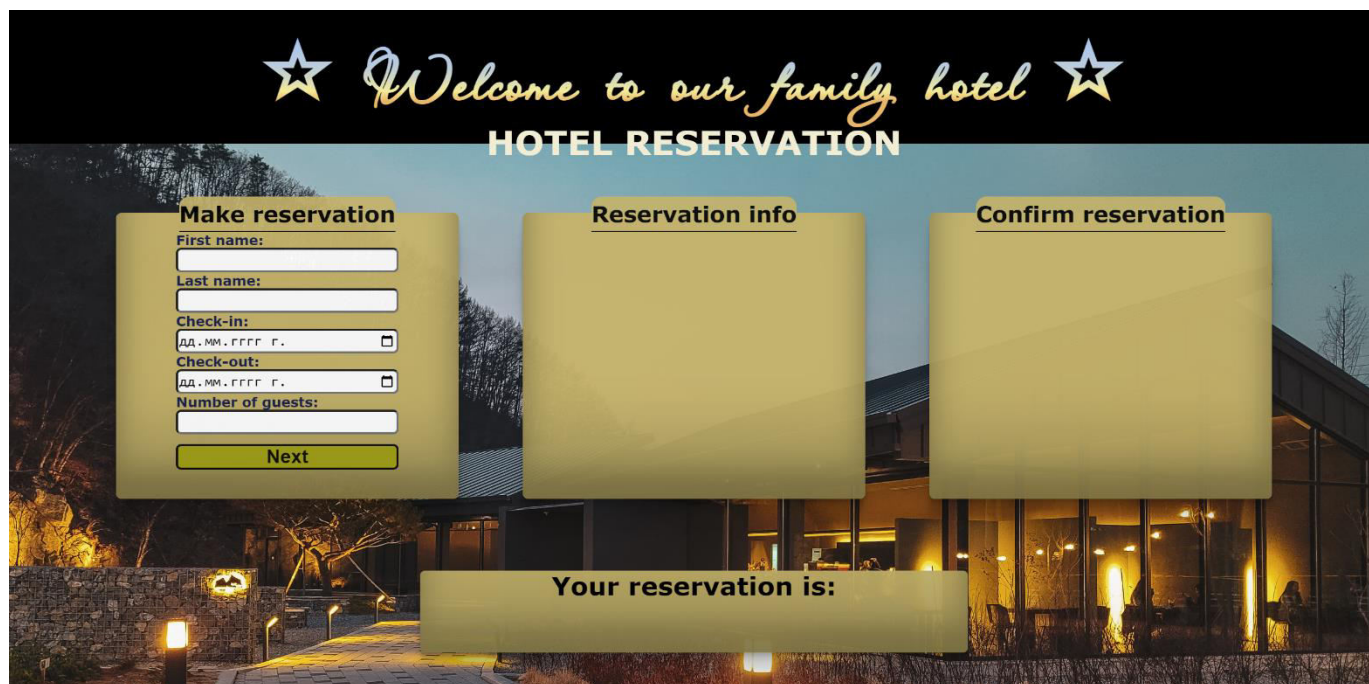

The following actions are **NOT** supported:

- `.forEach()` with **NodeList** (returned by `querySelector()` and `querySelectorAll()`)
- `.forEach()` with **HTMLCollection** (returned by `getElementsByClassName()` and `element.children`)
- Using the **spread-operator** (`...`) to convert a **NodeList** into an array
- `append()` in Judge (use only `appendChild()`)
- `prepend()`
- `replaceWith()`
- `replaceAll()`
- `closest()`
- `replaceChildren()`
- Always turn the collection into a **JS array** (`forEach`, `forOf`, et.)

If you want to perform these operations, you may use `Array.from()` to first convert the collection into an array.

Use the provided skeleton to solve this problem.

Write the missing **functionality** of this user interface. The functionality is divided in the following steps:

The image shows a user interface for a hotel reservation system. At the top, there is a header with two stars and the text "Welcome to our family hotel" in a cursive font, followed by "HOTEL RESERVATION" in a bold, sans-serif font. Below the header, there are three main sections: "Make reservation", "Reservation info", and "Confirm reservation". The "Make reservation" section contains form fields for "First name:", "Last name:", "Check-in:" (with a date picker), "Check-out:" (with a date picker), and "Number of guests:". There is a "Next" button at the bottom of this section. The "Reservation info" and "Confirm reservation" sections are currently empty. At the bottom of the interface, there is a section titled "Your reservation is:" which is also empty. The background of the interface is a photograph of a modern hotel building at night.

Your Task

Write the missing **JavaScript code** to make the **Hotel Reservation** work as expected:

All fields (**First Name**, **Last Name**, **Check-in date**, **Check-out date** and **Number of guests**) are **filled with the correct input**.

- First Name, Last Name, Check-in date, Check-out date and Number of guests are **non-empty strings** and Check-in date is **before** Check-out date. If any of them is empty, the program should not do anything.

1. Getting the information from the form

- On clicking the ["Next"] button the information from the input fields is listed in the "**Reservation info**" section. For the input fields a **list item** is **added** to the "**info-list**" unordered list.
 - The text format and order for the list item should be the same as on the picture below.
 - When the button is clicked, the input fields must be cleared and the ["Next"] button must be **disabled**. At the same time the "**Edit**" and the "**Continue**" buttons must be **enabled**.
- The HTML structure looks like this:

```
<h1>Reservation info</h1>
<ul class="info-list"> == $0
  <li class="reservation-content">
    <article>
      <h3>Name: John Doe</h3>
      <p>From date: 2022-12-24</p>
      <p>To date: 2023-01-01</p>
      <p>For 4 people</p>
    </article>
    <button class="edit-btn">Edit</button>
    <button class="continue-btn">Continue</button>
  </li>
</ul>
```

The functionality here is the following:

- When the **"Edit"** button is clicked, all of the **information** is **loaded** in the **input fields** from step 1 and the **["Next"]** button is **enabled** again.

★ *Welcome to our family hotel* ★
HOTEL RESERVATION

Make reservation

First name:

Last name:

Check-in:
 ☐

Check-out:
 ☐

Number of guests:

Next

Reservation info

Confirm reservation

Your reservation is:

- The **list items** must be **removed** from the **"info-list"** and all of the **information** must go back to the **input fields** again.

```
<h1>Reservation info</h1>
<ul class="info-list"> </ul> == $0
```

- When the **"Continue"** button is clicked, the information from **"info-list"** unordered list must be transferred to **"confirm-list"** in the **same** HTML structure. For you, this means **removing everything** inside of the **ul** with class = **"info-list"** and **adding** in **"confirm-list"**, the list item with same information and change **"Edit"** and **"Continue"** buttons to **"Confirm"** and **"Cancel"** with changed **class**.

★ *Welcome to our family hotel* ★
HOTEL RESERVATION

Make reservation

First name:

Last name:

Check-in:
 ☐

Check-out:
 ☐

Number of guests:

Next

Reservation info

Confirm reservation

Name: John Doe

From date: 2022-12-24

To date: 2023-01-01

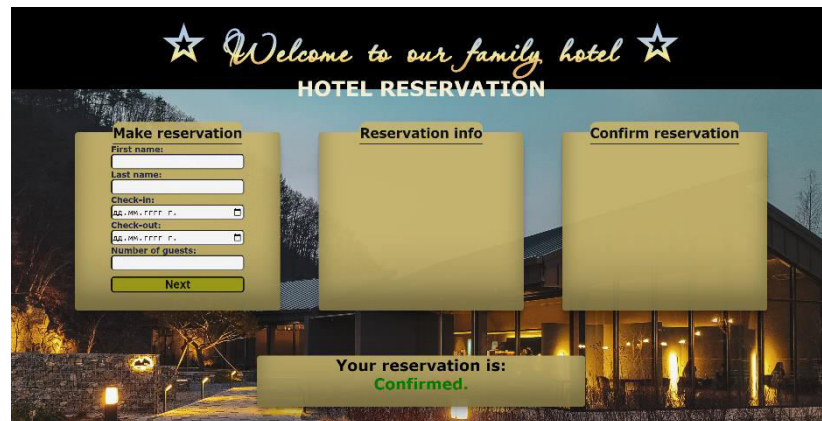

For 4 people

Your reservation is:

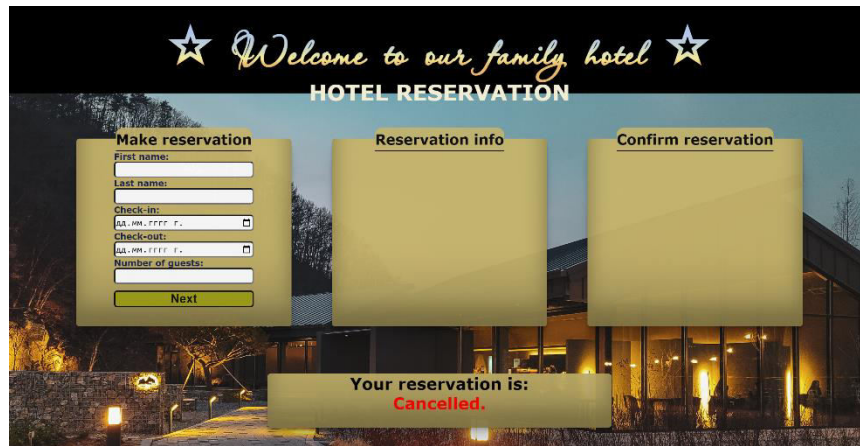

- This is HTML structure of "confirm-list" unordered list:

```
<h1>Confirm reservation</h1>
<ul class="confirm-list"> == $0
  <li class="reservation-content">
    <article>
      <h3>Name: John Doe</h3>
      <p>From date: 2022-12-24</p>
      <p>To date: 2023-01-01</p>
      <p>For 4 people</p>
    </article>
    <button class="confirm-btn">Confirm</button>
    <button class="cancel-btn">Cancel</button>
  </li>
</ul>
```

- When the "Confirm" button is clicked, the **list item** must be **removed**, from the "confirm-list", the ["Next"] button is **enabled** again you must add new **class** and add **text** to <h1> element with id="verification". If "Confirm" button is clicked **class** must be "reservation-confirmed" and **text** is "Confirmed."
- "Confirm" button:

- When the "Cancel" button is clicked, the **list item** must be **removed**, from the "confirm-list", the ["Next"] button is **enabled** again you must add new **class** and add **text** to <h1> element with id="verification". If "Cancel" button is clicked **class** must be "reservation-cancelled" and **text** is "Cancelled."
- "Cancel" button:

Submission

Submit only yours **solution()** function.

GOOD LUCK... 😊
